PURPOSE: To prolong a cycle life of a alkaline zinc storage battery. AΒ CONSTITUTION: A negative electrode and/or a separator contains at least one type of polyoxyethylene surface active agent selected from a group comprising polyoxyethylene alkylphenyl ether, polyoxyethylene alkyl ether, and polyoxyethylene alkylfatty acid. Thus, because the negative electrode and/or separator contains a specified polyoxyethylene surface active agent, a tree deposited zinc growing to cause internal shortage and the negative electrode fining to lower charging and discharging efficiency are hardly caused.
